## Choosing the Right Model

When finding a mathematical model to represent the trend in data (curve of best fit), how do you know whether to use a linear, quadratic, or exponential model?

## Answer: Look for patterns in the table of values.

Example: Determine what model would best represent the data in each table: linear, quadratic, or exponential.
a.

| X | -3 | -2 | -1 | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Y | 10 | 7 | 4 | 1 | -2 | -5 |

b.

| X | -2 | -1 | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Y | 6 | 3 | 2 | 3 | 5 | 9 |

c.

| X | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Y | 4 | 8 | 16 | 32 | 64 | 128 |

Sometimes it is difficult to tell from a scatter plot whether a trend is linear, quadratic, or exponential. To determine which model is the best fit in these cases, use the correlation coefficient, r. Remember, the closer this value is to $1 /-1$, the better the model fits the data.

## Example:

In 1990, the total debris in orbit around the Earth was approximately 1800 tonnes ( t ). The table shows the accumulated mass of debris for the following five years.

| Year | Mass of Debris (t) |
| :--- | :--- |
| 1990 | 1800 |
| 1991 | 2710 |
| 1992 | 3710 |
| 1993 | 4800 |
| 1994 | 5980 |
| 1995 | 7250 |

a. Enter the data into a table on Desmos but instead of entering the years themselves, make the first column "years since 1990". So for 1990, enter 0, for 1991, enter 1 and so on.
ie. The table you will enter is:

| $X$ | $Y$ |
| :---: | :---: |
| 0 | 1800 |
| 1 | 2710 |
| 2 | 3710 |
| 3 | 4800 |
| 4 | 5980 |
| 5 | 7250 |

b. Click on the wrench (tool) in the top right corner and adjust your window settings as follows:

$$
0 \leq x \leq 7 \text { and } 0 \leq y \leq 8000
$$

c. Determine a linear, quadratic, and exponential model for the data and record the correlation coefficient beside each equation.

LINEAR (formula: $y_{1} \sim m x_{1}+b$ )

QUADRATIC (formula: $y_{1} \sim a x_{1}{ }^{2}+b x_{1}+c$ )

EXPONENTIAL (formula: $y_{1} \sim a b^{x_{1}}$ )
d. Use each model to predict the mass of space debris in 2005.

LINEAR:

QUADRATIC:

## EXPONENTIAL:

e. Which model is most optimistic?
f. Which is most pessimistic?
g. Which model fits the data best? Explain how you know.
